

## **Problem Statement:**

### **Problem Statement – AI Agent for Faculty with NBA Accreditation Processes**

Faculty members involved in NBA accreditation often spend significant time searching through accreditation criteria, guidelines, required formats, and previous documentation. Preparing the Self Assessment Report (SAR), understanding accreditation requirements, and performing CO–PO mapping can be complex, time-consuming, and inconsistent when information is scattered across multiple documents.

The proposed solution is an AI Agent for Faculty with NBA Accreditation Processes using Retrieval-Augmented Generation (RAG). The agent will retrieve relevant NBA criteria, formats, guidelines, and past documentation from trusted sources and use the retrieved information to provide context-aware responses to faculty queries.

Faculty members will be able to interact with the agent to obtain guidance related to SAR preparation, CO–PO mapping, NBA criteria, and accreditation documentation. By grounding responses in retrieved documents, the RAG-based system can provide relevant and up-to-date information while reducing the risk of unsupported responses.

The solution aims to reduce manual effort, improve consistency, and speed up accreditation readiness, while supporting faculty in understanding and preparing NBA-related documentation.

### **Technology Requirement**

IBM Cloud Lite services and IBM Granite are mandatory.
